

Arconics AirPortal®

Controlled distribution of operational information

Arconics AirPortal

Controlled audited distribution of manuals and operational information for aircraft operators

Arconics AirPortal is a web portal application designed to reduce costs and **assure regulatory compliance** for aircraft operators. It enables communication and delivers manuals and personalized operational information to pilots, cabin crew, ground crew and engineering staff.

Managers can distribute essential information via the web to individuals or groups irrespective of their location. AirPortal **tracks the distribution** and receipt of information throughout the organisation.

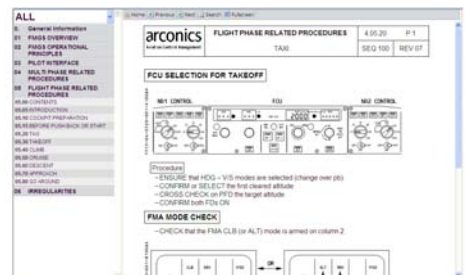

AirPortal allows content owners to require acknowledgement of receipt for important changes to manuals or operational information. The system records all acknowledgements, and provides **automatic escalation and notification** for items that are not read within defined timeframes. The logging and reporting system can produce reports that save significant management time during each audit cycle.

AirPortal has a range of modules to support flight and ground operations, including **Manual Library, Notices and Compulsory Reads, Forms and Messaging**.

It offers comprehensive **workflow** features and can help drive savings and efficiencies across the organisation by moving existing paper-based processes online.

AirPortal can integrate with existing enterprise systems to exchange data or automate processes. Documents and forms are processed in a **complete, consistent and compliant** manner across the entire organisation.

AirPortal **increases efficiency and reduces costs** across the aircraft operator by providing audited controlled distribution.

Key Benefits

- Reduces costs and ensures compliance
- Saves significant management time during each audit cycle
- Custom Portals for pilots, cabin crew, ground crew and engineering staff
- Confirmed Receipt, with escalation, notification and reporting
- Workflow engine, with aircraft operator workflows out of the box
- Highly configurable and secure

Custom Portals

AirPortal delivers custom portals for pilots, cabin crew and ground crew and engineering staff. Information and views can be personalized for specific groups or individuals. People access their personalised information from any web-connected device. No plug-ins are required; AirPortal can be used by remote crew from shared Internet terminals.

Confirmed Delivery

Compulsory Reads can be sent to individuals or groups, who must acknowledge that they have read and understood it.

AirPortal can provide email reminders and alerts about impending and past-due deadlines, and provides escalation and notification to managers of overdue items.

Workflows and Forms

The system comes, out of the box, with forms and workflows to support many of the requirements of aircraft operators. The workflow engine supports long and complex workflows and new workflows can be easily defined through a web interface.

Simplifies Compliance

AirPortal's logging, audit and reporting features saves significant time and money in every audit cycle.

Intuitive User Interface

The user interface has been refined over years of development and successful implementation in aircraft operators. The look and feel and navigational structures are easily modified by authorised users through a web interface. AirPortal use does not require formal training for staff.

User Management and Security

AirPortal has a comprehensive security model with multiple levels of access, groups, and the ability to cascade permissions through the system. It integrates with existing enterprise authentication systems. AirPortal can restrict permissions for users when they are outside the corporate network.

Search

The system supports intelligent search and allows an administrator to change the default result order on specific terms to prioritize the most relevant search results to the top of the page.

Fast Easy Deployment

AirPortal can be deployed onsite in the operator or accessed as a hosted managed service from Arconics.
